PROFILE

RWA operator who builds tokenized products and then owns their growth. **10+ years** shipping production software, the last two dedicated entirely to real-world-asset tokenization: issuer structuring under a regulated digital-rights regime, instrument design, liquidity incentives and distribution. Built a working city-economy tokenization stack from zero — an open city guide, a paid membership circle and a revenue-share instrument structured together with an operator from the national registry — and took that design to real, revenue-generating businesses. I understand the machinery that decides who can hold an asset at all — allowlists, transfer restrictions, KYC/KYB gates — because I have operated on both sides of it, and I know where tokenized products actually die after launch: liquidity, secondary-market design and distribution, not the smart contract.

CORE EXPERTISE

Tokenization & product

RWA issuance structuring · instrument design (monetary claims, revenue share, funds) · NAV and redemption mechanics · issuer pipeline qualification · post-launch growth playbooks · TVL/AUM metrics

Liquidity & market structure

Market-maker relationships · DEX/AMM integrations · yield strategies for tokenized collateral · secondary-market development · oracle and liquidation mechanics

Institutional & compliance

Operator-registry issuance workflow · qualified / non-qualified investor limits · allowlists and transfer restrictions · sanctions and KYC screening reality · jurisdiction mapping (US / EU / CIS) · partner success and KPI reporting

Technical

Solana (SPL tokens, transfer-fee and holder-incentive mechanics, tooling) · Python · TypeScript / Node.js · Docker · APIs and data pipelines · AI-assisted delivery · GitHub CI

EXPERIENCE & IMPACT

RWA Structuring & Tokenization Practice

2025 — present

Founder & Lead — independent advisory for real-economy issuers

- Built an end-to-end issuance service for businesses: qualification diagnostics → structure → operator onboarding → placement support → holder reporting. Commercial model: fixed-fee diagnostics, fixed structuring fee, **success fee on placed volume**.
- Designed the full issuance pattern for a revenue-share instrument: issuer entity, operator from the Bank of Russia registry under **259-FZ (digital financial assets)**, the instrument as a monetary claim, unit nominal, payout schedule from venue revenue, limits for non-qualified investors.
- Assembled and qualified a pipeline of **dozens of business owners** with live revenue and legal entities; applied a hard against-the-alternative test (does the tokenized structure beat a plain loan?) to keep the pipeline honest.
- Isolated the real growth bottleneck and built the process around it: technology deploys in weeks, whereas a business owner's consent to put revenue into a regulated instrument takes months. **Trust is the growth lever**; code is not.

City AI + City Code

2026 — present

Founder & Product Lead — city-economy tokenization stack, built in public

- **City AI (open layer)**: Telegram bot on Python / aiogram 3 in Docker, Google Sheets as the live data store, Cloudflare Worker for community submissions — **200+ food venues**, **100+ locations**, routes and events, XP mechanics, resident-contributed content, zero barrier to entry.
- **City Code (closed layer)**: paid membership circle built on six keys — rules, partner perks, the partner network itself, closed events, market insights, member community. Converts free reach into recurring revenue and into standing with local businesses.
- **City RWA (ownership layer)**: structuring a share of a real venue's revenue as a digital financial instrument — the pilot that proves the model on one asset type before scaling across others.

- Growth logic that transfers to any RWA issuer: **open** → **enter** → **own**. Each layer funds the next; community and revenue exist before any token does — the reverse of how most tokenization projects are built.

RWA Research, Market Education & Distribution

2024 – present

Author & publisher — EN/RU

- Book-course “**RWA: We Explain**” — **13 chapters**, a **76-term glossary** and a **6-module course** with assessment; deliberately no price calls and no signals. Used as market education for non-institutional audiences and as sales-enablement material for owners weighing an issuance.
- Published analysis of the adoption gap that RWA growth teams are paid to close: the market multiplied roughly 5× in a year to \$25–35B, still **under 1% of global stocks and bonds**, with institutions capturing most of it. Argued and evidenced where retail access actually comes from.
- Built the publishing and design system behind it: JSON-driven cover renderer (Node.js + SVG + @resvg/resvg-js), strict brand canon, parallel EN/RU content pipeline, GitHub Pages distribution.

Solana Ecosystem

2026 – present

Builder — tooling, incentives, community assets

- Ship and operate Solana-side tooling: **SPL token launches**, holder-reward and **transfer-fee redistribution** mechanics, Telegram trading and notification bot infrastructure in Python.
- **Superteam Earn** contributor; built community assets and custom emoji/sticker packs for RWA Foundation (@RWAFoundation_) — early-stage, retail-facing RWA community building.
- Track the Solana RWA stack closely: tokenized treasuries and funds, transfer restrictions in the Token Extensions style, DeFi integrations, RWA market dashboards (RWA.xyz) and ecosystem programmes.

Software Engineering

10+ years

Full-cycle delivery

- 10+ years of full-cycle delivery: requirements, architecture, implementation, deployment, operations, tests, secrets management. Comfortable being the sole technical owner of a product.
- Python (aiogram, automation, data tooling) · JavaScript / TypeScript and Node.js (rendering, tooling) · Docker · REST APIs · Google Workspace API · Cloudflare Workers · GitHub Actions · Google Colab. AI-assisted development as a delivery multiplier.

PROFESSIONAL DEVELOPMENT

- **RWA & tokenization**: tokenized treasuries, private credit, funds, real estate, commodities — instrument mechanics end to end.
- **Digital-asset regulation**: 259-FZ (digital financial assets) and 282-FZ (digital currency), operator-registry mechanics, qualified / non-qualified investor regimes, sanctions and payment-rail reality across the CIS.
- **DeFi market structure**: AMM vs. order book, oracles, liquidation engines, yield strategies, market making.
- **Solana development track** and AI-assisted product delivery; continuous self-directed study with published output at every stage.
