STABLECOIN OPERATIONS CONTROL

When your systems disagree about money, see what actually happened.

Your records say one thing.
Your provider says another.
The blockchain shows something else.

ChainZap lines up the evidence so your team can see what matched, what didn't, and what still needs a decision.

MANUAL REVIEW

Most payments close cleanly. ChainZap is for the ones that don't.

THE CASES THAT STAY OPEN

The hard part starts when the transfer is technically done, but the case still isn't closed.

CASE 01 Confirmed, not resolved	INTERNAL SYSTEM NOT CREDITED	BLOCKCHAIN CONFIRMED	PROVIDER / WALLET UNRESOLVED	STILL NEEDS A DECISION CREDIT · WAIT · ESCALATE
CASE 02 Systems disagree	INTERNAL LEDGER SETTLED	PROVIDER COMPLETED	WALLET / ON-CHAIN DOESN'T FULLY MATCH	STILL NEEDS A DECISION ACCEPT · DISPUTE · REVIEW
CASE 03 Retry / duplicate ambiguity	EXPECTED PAYOUT 1,000 USDT	ATTEMPT 1 TIMEOUT → LATER CONFIRMED	RETRY 1,000 USDT · CONFIRMED	WHAT ACTUALLY MOVED 2,000 USDT

STILL NEEDS A DECISION

CLOSE · RECOVER · ESCALATE

All examples are illustrative. Internal and provider states come from the data you share for review.

ONE CONTROL LAYER

One system rarely shows the full picture.

Your internal system shows what the business recorded.

Your provider or wallet shows what was submitted or reported.

The blockchain shows what actually moved.

ChainZap compares the evidence and keeps unresolved cases visible.

UNKNOWN ≠ VERIFIED

If the available evidence is not enough, the case stays open. No false green.

BUSINESS CONTEXT → EXECUTION EVIDENCE → REASON → NEXT ACTION

HOW IT WORKS

Start with one real workflow.

YOU PROVIDE

A small historical sample from a workflow your team already handles:

- Business reference
- Expected amount, recipient or status
- Provider or wallet export you already have
- Token and network
- Transaction hash where available
- Attempt or status history where available

CHAINZAP CHECKS

- What actually executed on-chain
- Expected vs actual
- Finality
- Duplicate or incomplete execution
- Network or token mismatch
- Conflicting states across the case

YOU GET

- Matched records
- Mismatches
- Unresolved cases
- Reasons and evidence references
- Recommended next action
- A short findings walkthrough

ChainZap checks and recommends. Your systems move the money.

No production integration is required for the first review.

Selected technical workflows can also use existing ChainZap transaction checks via API. Developers →

ONE MODEL · DIFFERENT WORKFLOWS

Different workflows. Same control problem.

DEPOSITS

Confirmed on-chain, but the customer or merchant is still not credited.

SETTLEMENTS

Provider, internal ledger and wallet evidence don't tell the same story.

PAYOUTS

A timeout or retry leaves uncertainty about what actually executed.

EDGE CASES

Network or token mismatch, partial payment, missing reference or incomplete evidence keeps the case open.

ChainZap is most useful when someone still has to open an explorer, compare records and reconstruct what happened before the next action.

AFTER NORMAL AUTOMATION

Built for the cases left after normal automation.

KYT can flag whether an address or transaction looks risky.

A payment processor can report what happened inside its own system.

Reconciliation software can match clean records at scale.

ChainZap focuses on the exceptions where those systems still don't produce one clear operational answer.

If your current stack already closes the case cleanly, ChainZap should stay out of the way.

START HERE

Stablecoin Exception Review

Start with the transactions your team already had to investigate manually.

Send a small historical sample from one real workflow. ChainZap reconstructs the available evidence and returns what matched, what didn't, what remains unresolved, and why.

No public file upload · We agree the data scope first

If the same exception keeps recurring, we can scope that exact check for ongoing control.

What usually goes wrong?

Confirmed on-chain, unresolved internally | Provider status disagrees | Retry / duplicate ambiguity | Partial / wrong amount | Network / token mismatch | Other

How often does it happen?

Select

Approximate monthly stablecoin transactions

Select

Can you share a small historical sample after scope agreement?

Yes | Need to check | No

What is the last case your team had to investigate manually?

Get started →

No public file upload · We agree the data scope first

Independent by design.

NON-CUSTODIAL

Your funds stay where they are.

NO PRIVATE KEYS

ChainZap never signs transactions.

REVIEW FIRST

No production integration is required for the first review.

KEEP YOUR STACK

Keep your wallets, providers, KYT and ledger.

EVIDENCE, NOT GUESSES

If the evidence is not enough, the case stays unresolved.

Data scope is agreed before anything is sent.
